

Project Prompts Log

Prompts used throughout the DPO Implicit Reward project

1.

I have previously created a project proposal for my graduate rl course. now pls plan out the tasks needed to accomplish this. for context the proposal is given in

2.

when you are done planning I want you to init a git repo and create a repo structure for the project for my team and I to work on and create a list of subtasks I need to accomplish for implementing the project.

3.

also my instructor gave feedback after the proposal that I should use benchmark datasets

4.

okay show me the list of tasks first

5.

why baseline on cpu ? shouldn't we run the baselines on gpu as well?

6.

I think you should use existing baseline datasets for this task. that is what I meant to say. My instructor just commented to use baseline datasets after we submitted the feedback

7.

and use this git repo to push the project here <https://github.com/silvererudite/dpo-implicit-reward.git> only use my credentials to commit and push and no coauthorship.

8.

check if you have access to pull repos from my github

9.

I have the PAT now need you to clone repo

10.

what do I do with the .gitconfig file for you to have the token ?

11.

just use this credential for now [REDACTED CREDENTIAL] here is the repo name <https://github.com/silvererudite/dpo-implicit-reward> pls clone it go into that and start working from the task list

12.

and log the run to wandb

13.

commit it all as one commit

14.

and save the trained artifacts to HF for me

15.

and stop the training of Bradley terry for now

16.

how long will eval take ?

17.

use this token for HF to upload publicly [REDACTED CREDENTIAL]

18.

yes add the results table to hf and github and commit it

19.

push it

20.

yes (approval to rebuild the environment on persistent EFS storage after the ephemeral NVMe mount was wiped by an instance restart)

21.

yes start with the seeds and log the experiment in wandb as usual and make sure to save any artifacts in hf as well

22.

check the status of the seed runs

23.

what can you make from training alone

24.

i dont understand, pls tell me without jargon

25.

check the eval status

26.

how far is the evaluation ?

27.

create interesting plots with the data and results so that I can interpret them or any reviewer can interpret them

28.

can you help me analyse the results like a reviewer, what aspects would a reviewer consider ?

29.

i dont understand what you are saying

30.

okay repeat for more runs then prepare to train for longer

31.

check the eval status

32.

is the new training running ?

33.

i need you to regenerate the figures, but this time experiment with different ways to visualize the information also what about the previous surprising finding now that you flagged earlier the one with random baseline beating trained and untrained ones

34.

also make a figure where it shows types of responses with examples somehow that the implicit, explicit and untrained model prefer

35.

push the commit, this is the new HF token that I will rotate pls commit and stage the latest changes
[REDACTED CREDENTIAL]

36.

create a draft new report with latest observations, changes and experiments with figures for ppl in my team to interpret. clearly state the hypothesis and methods and the experiments I did to make progress before this long training run. make a pdf and save to repo

37.

start the convergence run

38.

is the training done?

39.

yes do those tasks, regenerate and push the team report and then tell me. also tell me your observations after the training. extract and preserve the training curves for me to use later as well

40.

what is the bias scoring here that you are doing

41.

did you stage and push everything?

42.

yes upload the checkpoints to hf and also document there how to access each of the different checkpoints etc

43.

okay git pull the latest changes and tell me how far things are done

44.

okay the project is almost ready for submission with the current progress. you need to look at the remote repo for the latest changes pushed and a pr for the report. look at section 2, 2.1 and figure 1. i think figure 1 is wrong and is the pipeline correct on what I did

45.

can you create a corrected tikz model and save it locally first for me to review

46.

[attached a screenshot of the rendered figure] this picture is correct but way too complex. you need to find an easier way to visualize this picture. maybe some other form of figure that shows the steps etc clearly but in a more research paper way

47.

Based on the codebase, project proposal, reference papers write the first draft of this project paper following the given template. First gather context from the codebase, reference files and template. Then write the draft.

48.

Go through the report in final_report folder. Check for any grammatical errors. Do not fix the errors in main.tex file. Come back to me with a report of the errors and suggested fixes. Write an error fix suggestion report in a markdown file.

49.

Go through the report in final_report folder. Suggest me writing improvements. Do not make changes in main.tex. Give me a report of your findings. Write the report in a markdown file.

50.

Go through the report in final_report folder. Write a report on the overall quality. If you find any inconsistencies report back to me. Do not make changes to the report. Write your report in a markdown file.
